

Jabber Jaw Telecom SIP Trunking service is simply a line replacement option that is significantly less expensive than traditional analog lines and PRI services.

Jabber Jaw Telecom SIP Trunking services typically save customers around 50-75% on their local and long distance phone bills.

The service requires high speed internet bandwidth and works with your existing phone system so there is no need to replace phones or equipment. And, unlike with PRIs, you purchase only the trunks you need based on your maximum number of concurrent calls. As a matter of fact, the Jabber Jaw Telecom SIP Trunking provides you with more than enough trunks to insure that you never have a busy signal!

Key Advantages of SIP TRUNKING

Cost savings of 50% or more

The Jabber Jaw Telecom SIP Trunking service is quick and easy to deploy and can work for your company in one of two ways depending on the type of phone system (PBX) that you currently have.

IP PBX Telephone Systems – Most new phone systems sold today fall into this category and are SIP-enabled. The Connection to the Jabber Jaw network is very simple with no additional equipment required as all end points (IP or Digital Phones) communicate with our switch through internet protocol.

Analog PBX Telephone Systems – Connecting your analog PBX to the Jabber Jaw network requires a SIP interface, VoIP gateway or ATA (analog telephony adapter). The ROI for this equipment is very short and cost effective.

When one of the two options above have been deployed, your SIP network will look like one of the illustrations in this brochure.
